which act on in vivo immunomechanism of human beings and livestock (in particular cells relevant immue responses) and are useful as immunoregulating agents.

Muramyl peptide derivatives and immunoregulating compositions containing them

BACKGROUND OF THE INVENTION

field of the Invention

The present invention relates to novel muramyl peptide derivatives. The muramyl peptide derivatives of the present invention acts on in vivo immunomechanism of human beings and livestock (in particular cells relevant to immune responses) and are useful as immunoregulating agents.

2. Description of the Prior Art

Muramyl peptides are known to possess various biological activities. That is, they possess in vitro activities such as;

- (1) the action on cells related to immune responses (for example, monocytes or macrophages, B cells, T cells, natural killer (NK) cells and the like),
- (2) the action on cells other than those mentioned above (for example, platelets, endothelial cells, fibroblasts and the like), and
 - (3) the action which activates complement systems.

Further they show in vivo activities such as (1) immunoregulating action, and (2) enhancement of natural resistance [see Saishin Igaku, 43, No. 6, pp. 1268-1276 (1988) in Japan].

Known muramyl peptide derivatives are, for example, B30-muramyl dipeptide [Kusumoto et al; Tetrahedron letters, 49 pp. 4899-4902(1978)], muramyl dipetide-lysine [Matsumoto et al, Immunostimulants, pp. 79-97 (1987)] and those discribed in Japanese Published Unexamined Patent Application Nos. 172399/1983, 20297/1984 and 275299/1986.

However, it is still desired to develop compounds other than the known muramyl dipeptide derivatives which have more excellent activity and less toxicity.

SUMMARY OF THE INVENTION

According to the present invention, a muramyl dipeptide derivative is provided, which is represented with the following formula (I):

wherein "Ala" is

$$(\text{CH}_2)_{\text{n}}-\text{CH}_3$$

(m is an integer from 11 to 17; n is an integer from 11 to 17)]; and R₂ is a hydrogen atom or-CO-(CH₂)_pCH₃ (p is an integer from 8 to 22).

The present invention also provides an immunoregulating composition comprising a compound of the formula (I) and a pharmaceutically acceptable carrier.

DESCRIPTION OF THE PREFERRED EMBODIMENTS

In the formula (I), examples of the groups R₃ in the group -OR₃ or -SR₃ include 3-dodecanoyloxydodecanoyl, 3-tridecanoyloxydodecanoyl, 3-tetradecanoyloxydodecanoyl, 3-pentadecanoyloxydodecanoyl, 3-hexadecanoyloxydodecanoyl, 3-heptadecanoyloxydodecanoyl, 3- octadecanoyloxydodecanoyl, 3-nonadecanoyloxydodecanoyl, 3-eicosanoyloxydodecanoyl, 3-docosanoyloxydodecanoyl, 3-heneicosanoyloxydodecanoyl, 3-tricosanoyloxydodecanoyl, 3-tetracosanoyloxydodecanoyl, 3-dodecanoyloxytridecanoyl, 3-3-tetradecanoyloxytridecanoyl, 3-pentadecanoyloxytridecanoyl, 3-hextridecanoyloxytridecanoyl, adecanoyloxytridecanoyl, 3-heptadecanoyloxytridecanoyl, 3-octadecanoyloxytridecanoyl, 3-nonadecanoyloxytridecanoyl, 3-eicosanoyloxytridecanoyl, 3-docosanoyloxytridecanoyl, 3-heneicosanoyloxytridecanoyl, 3tricosanoyloxytridecanoyl, 3-tetracosanoyloxytridecanoyl, 3-dodecanoyloxytetradecanoyl, 3-tridecanoyloxytetradecanoyl, 3-tetradecanoyloxytetradecanoyl, 3-pentadecanoyloxytetradecanoyl, 3-hexadecanoylox-3-nonadecanoylox-3-heptadecanoyloxytetradecanoyl, 3-octadecanoyloxytetradecanoyl, ytetradecanoyl, 3-docosanoyloxytetradecanoyl, 3-heneicosanoyloxytetradecanoyl, 3-eicosanoyloxytetradecanoyl, 3-tetracosanoyloxytetradecanoyl. 3-dodecanoyloxypenytetradecanoyl. 3-tricosanoyloxytetradecanoyl, tadecanoyl, 3-tridecanoyloxypentadecanoyl, 3-tetradecanoyloxypentadecanoyl, 3-pentadecanoyloxypen-3-heptadecanoyloxypentadedanoyl, 3-octadecanoyloxypentadecanoyl, 3-hexadecanoyloxypentadecanoyl, 3-eicosanoyloxypentadecanoyl, 3-docosanoy loxypen-3-nonadecanoyloxypentadecanoyl. tadecanoyi. 3-tricosnovloxypentadecanoyl, 3-tetracosanoyloxypen-3-heneicosanoyloxypentadecanoyl, tadecanovi, 3-tridecanoyloxyhexadecanoyl, 3-tetradecanoyloxyhex-3-dodecanoyloxyhexadecanoyl, tadecanoyl, 3-hexadecanoyloxyhexadecanoyl, 3-heptadecanoyloxyhexadecanoyl, 3-pentadecanoyloxyhexadecanoyl, 3-eicosanoyloxyhex-3-octadecanoyloxyhexadecanoyl, 3-nonadecanoyloxyhexadecanoyl, adecanoyl, 3-heneicosanoyloxyhexadecanoyl, 3-tricosanoyloxyhex-3-docosanoyloxyhexadecanoyl, adecanoyl,

adecanoyi, 3-tetracosanoyloxyhexadecanoyi, 2-dodecyltetradecanoyi, 2-tridecyltetradecanoyi, 2-tetradecyltetradecanoyi, 2-pentadecyltetradecanoyi, 2-hexadecyltetradecanoyi, 2-heptadecyltetradecanoyi, 2-octadecyltetradecanoyl, 2-tetradecylpentadecanoyl, 2-pentadecylpentadecanoyl, 2-hexadecylpentadecanoyl, 2heptadecylpentadecanoyl, 2-octadecylpentadecanoyl, 2-dodecylhexadecanoyl, 2-tridecylhexadecanoyl, 2tetradecylhexadecanoyl, 2-pentadecylhexadecanoyl, 2-hexadecylhexadecanoyl, 2-heptadecylhexadecanoyl, 2-octadecylhexadecanoyl, 2-dodecylpentadecanoyl, 2-tridecylpentadecanoyl, 2-tetradecylpentadecanoyl, 2-2-heptadecylpentadecanoyl, 2-hexadecylpentadecanoyl. pentadecylpentadecanoyl, tadecanoyl, 2-dodecylhexadecanoyl, 2-tridecylhexadecanoyl, 2-tetradecylhexadecanoyl, 2-pentadecylhexadecanoyi, 2-hexadecyihexadecanoyi, 2-heptadecyihexadecanoyi, 2-octadecyihexadecanoyi, 2-dodecyiheptadecanoyi, 2-tridecylheptadecanoyi, 2-tetradecylheptadecanoyi, 2-pentadecylheptadecanoyi, 2-hexadecylheptadecanoyi, 2-octadecylheptadecanoyi, 2-dodecylocta- decanoyi, 2-tridecyloctadecanoyoi, 2tetradecylocta- decanoyl, 2-pentadecyloctadecanoyl, 2-hexadecylocta- decanoyl, 2-heptadecyloctadecanoyl, 2-octadecylocta- decanoyl, 2-dodecylnonadecanoyl, 2-tridecylnona- decanoyl, 2-tetradecylnonadecanoyl, 2pentadecylnona- decanoyl, 2-hexadecylnonadecanoyl, 2-heptadecylnona- decanoyl, 2-octadecylnonadecanoyl, 2-dodecyleicosanoyl, 2-tridecyleicosanoyl, 2-tetradecyleicosanoyl, 2-pentadecyleicosanoyl, 2-hexadecyleicosanoyl, 2-heptadecyleicosanoyl and 2-octadecyleicosanoyl groups.

Preferred groups of R₃ are 3-tetradecanoyloxytetradecanoyl, 3-hexadecanoyloxytetradecanoyl, 3-octadecanoyloxytetradecanoyl, 3-tetracosanoyloxytetradecanoyl and 2-tetradecylhexadecanoyl groups.

Examples of R₂ include hydrogen atom, decanoyl, undecanoyl, dodecanoyl, tridecanoyl, tetradecanoyl, 20 pentadecanoyl, hexadecanoyl, heptadecanoyl, octadecanoyl, nonadecanoyl, eicosanoyl, docosanoyl, heneicosanoyl, tricosanoyl and tetracosanoyl groups.

R₂ is preferably hydrogen atom or tetradecanoyl group.

Preferably, "Ala" is an L-alanine residue, and "isoGln" is a residue derivated from D-isoglutamine.

The compounds of the formula (I) of the present invention are basically muramyl dipeptide derivatives. in which the muramyl dipeptide moiety has preferably the same steric configuration as that of the muramyl dipeptide moiety in natural muramyl dipeptides. Namely, the moieties of muraminic acid and dipeptide in the present muramyl dipeptides have D-steric configuration and L-alanine-D-isoglutamine configuration, respectively. However, the muramyl dipeptides of the present invention may be those having other possible steric configurations.

The group -OR3 or -SR3 in the definition of the formula (I) preferably combines with the saccharide moiety in the form of α -bond and β -bond, respectively.

The acyloxyacyl group in R₃ has an asymmetric carbon atom and may be in the form of D- or Lisomer, or racemic mixture.

Interesting compounds belonging to the formula (I) in the present invention include:

35 N-[2-0-{2-Acetamido-2,3-dideoxy-1-0-(2-tetradecylhexadecanoyl)-α-D-glucopyranos-3-yl}-D-lactoyl]-L-alanyl-D-isoglutamine methylester

The compounds of the present invention can be basically prepared by the following process.

CH₃
CH
NHCOCH₃
CO
Ala-isoGln-OCH₃
(III)

55

50

30

In the formulae, X is OH or SH; R1 and R2 are defined as above.

The above mentioned process consists of two acylation steps (the acylations at 6th and 1st positions of the glucopyranose moiety) and one deacetonation step.

The two acylation steps can be conducted by reacting a compound of the formula (II) or (I) with a specific acylating agent (R₂H, R₃H or its reactive derivative). These steps are generally carried out in an anhydrous organic solvent (for example, dimethylformamide or dioxane) and at room temperature or a slightly elevated temperature. When R₂H or R₃H (a free acid) is used, it is conducted in the presence of an appropriate condensing agent (for example, dicyclohexylcarbodiimide, N-cyclohexyl-N -morpholinoethylcarbodiimide, N-cyclohexyl-N -(4-diethylaminocyclohexyl)-carbodiimide or N,N -diethylcarbodiimide). Examples of reactive derivatives of R₂H or R₃H are conventional reactive derivatives used in acylation, such as mixed acid anhydrides, active esters, acid halides and the like. The deacetonating step can be readily conducted under an acid hydrolysis condition (e.g., using 80% acetic acid aqueous solution) at a slightly elevated temperature.

The compounds of the formula (II) are known or can be readily prepared by known methods.

The compounds obtained by the above process may be purified by a conventional method such as a column chromatography using almina or silica gel, recrystallization and the like.

The compounds of the formula (I) of the present invention have an action for enhancing function of cells relevant to in vivo immune response and an action for increasing the number of said cells, and hence they are useful as an immunoregulating agent. The immunoregulating agent of the present invention can be used to enhance in vivo activities of vaccines such as BCG vaccine, hepatitis vaccine, influenza virus vaccine or the like, various antibacterial agents or anti-tumor agents.

The immunoregulating composition of the present invention comprises a compound of the formula (I) and a pharmaceutically acceptable carrier. The composition may be any dosage form for oral and parenteral administrations.

The compositions for oral administration are generally dosage forms such as powders, tablets, emulsions, capsules, granules and liquid prepartions (including liquid extracts, syrups and the like).

Examples of carriers for powders or other orally administrable solid preparations include lactose, starch, dextrin, calcium phosphate, calcium carbonate, synthetic or natural aluminium silicate, magnesium oxide, dried aluminium hydroxide, magnesium stearate, sodium bicarbonate, dried yeast and the like, and those for liquid preparations include water, glycerine, propylene glycol, simple syrup, ethanol, fatty oil, ethylene glycol, polyethylene glycol, sorbitol and the like. A typical example of the composition for parenteral administration is an injection. Liquid carriers for the injection include sterile distilled water. When a compound of the formula (I) is less soluble in water, an appropriate solubilizer is used. Each of the above preparations can be prepared by conventional methods.

When the compounds of the formula (II) of the present invention are used for enhancement of antitumor agents, they may be orally or parenterally administered to an adult human in an amount of 150 to 250µg/day in one dose. When used for enhancement of vaccines, they may be administered to an adult human in an amount of 0.5 to 2.0mg/1 to 2 weeks in one dose. For treatment of hepatitis, they may be orally or parenterally administered to an adult human 1 to 3 times for 3 months in an amount of 0.5 to 2.0mg in one dose. For enhancement of antibacterial agents, they may be used to an adult human in an

amount 20 to 100µg/day in one dose.

The immunoregulating agents of the present invention may be generally used by formulating themselves only as described above. But they may be formulated together with an agent to be enhanced its action.

Further, the immunoregulating agents of the present invention can be used for not only humans but also other mammals such as pigs, bovines, sheeps, dogs, and cats.

The present invention is illustrated with following examples.

Example 1

N-[2-0-{2-Acetamido-2,3-dideoxy-1-0-(2-tetradecylhexadecanoyl)- α -D-glucopyranos-3-yl}-D-lactoyl]-L-alanyl-D-isoglutamine methylester

The compound of the formula (III) wherein R₁ is 2-tetradecylhexadecanoyloxy group (279.4mg, 0.281mmol) was dissolved in 80% acetic acid aqueous solution (8ml) and the resultant was allowed to stand for 2 hours at 45°C. After confirming the completion of the reaction with T.L.C.(CH₂Cl₂: MeOH = 10:1), the resultant was concentrated under reduced pressure to obtain quantitatively the title compound (266.2mg).

Pharmacological activities of the compounds of the present invention are shown as follows.

15

(1) Hepatitis-vaccine enhancing activity (adjuvant activity)

A compound of the present invneiton was dissolved in lipidmicrosphere (1mg/ml). On the other hand, a solution of hepatitis B virus surface antigen (HBs) in physiological saline was prepared (50µg/ml). The above solutions in equal amounts were mixed to prepare a test solution. A control solution was prepared by the exclusion of the compound of the present invention from said test solution. A mixture of a suspension of aluminium hydroxide gel in physiological saline (1mg/ml) and said hepatitis vaccine preparation in equal amounts was prepared as another control solution. The test solution (0.2ml) was intraperitoneally administered to each mouse in one group consisting of seven female CDF₁ mice.

Blood samples were collected from the fundus ocluli vein of each mouse every week after the administration and then centrifuged to obtain serums. Three weeks after the administration, 0.2ml of the test liquid was intraperitoneally administered again to each mouse for secondary stimulation. Then blood collecting was conducted every week to obtain serums after the application of the secondary stimulation, in the same manner as that described above.

The amount of the IgG antibodies against the hepatitis B virus surface antigens (HBs) in the serums thus obtained was determined with an ELISA method. The results are shown in Table 1.

(2) Influenza HA vaccine enhancing activity (adjuvant activity)

A compound of the present invention was dissolved in lipidmicrosphere (1mg/ml). On the other hand, a solution of influenza HA vaccine (B/nagasaki/1/87 strain) in physiological saline was prepared (100 ccA/ml). The above solutions in equal amounts were mixed to prepare a test solution. A control solution was made by the exclusion of the compound of the present inveniton from said test llquid. A mixture of a suspension of aluminium hydroxide get in physiological saline(1mg/ml) and said influenza HA vaccine preparation in equal amounts was prepared as another control liquid. The test solution (0.2ml) was intraperitoneally administered to each mouse in one group consisting of seven female CDF₁ mice.

Blood samples were collected from the fundus oculi vein of each mouse every week after the administration and then centrifuged to obtain serums. Three weeks after the aministration, 0.2ml of the test liquid was intraperitoneally administered again to each mouse for secondary stimulation. Then, blood collecting was conducted every week to obtain serums after the application of the secondary stimulation, in the same manner as that described above.

The amount of the IgG antibodies against the influenza HA vaccine (B/Nagasaki/1/87 strain) in the serums thus obtained was determined with an ELISA mehtod. The results are shown in Table 2.

(3) Activation of macrophages (an effect which inhibits the growth of tumor cells)

A compound of the present invention was dissolved in lipidmicrosphere to obtain a solution in a concentration of 500µg/ml, and 0.2ml of such solution was intraperitoneally administered to each mouse in one group consisting of seven female CDF₁ mice. Intraperitoneal macrophages obtained three days after the administration and L-1210 mouse leukemia cells were mixed in the ratio of cell numbers of 20 : 1, respectively. Two hundred µl of the mixture was placed in each well of one sheet of 96 well microtiter plate. After 72 hours, the increase of the cell number in each well was determined by a MTT assay method. The ratio of the cell number for the mixture of the L-1210 cells and the macrophage relative to the cell number for the L-1210 cells only(growth inhibitory ratio) was determined, and the results are shown in Table 3.
